2) to get an optimal policy we need $v^*(s)$ and $p(s', r | s, a)$

or

we only need $q_*(s, a)$

4) Agent cannot see into the future.

5) Reward S_{ij} best in the immediate sense, value function specifies what is good in the long term.

9) policy evaluation algo must be executed iteratively because it would then converge to the $v_\pi(s)$.
